Installation and Running Instructions

How to install, run and check the Library Platform on a clean machine

Team	Distributed Developments (group project)
Members	Mohammed Nurul Hasan (S376146)
	Md Rakibul Hassan Emon (S375332)
	Md Modasser Hossain (S375173)

Product	Library Platform, .NET 10 ASP.NET Core MVC
Version	1.0
Date	16 October 2026

For a clean Windows, macOS or Linux machine (including the assessor's virtual machine). Allow about 10 minutes.

What you need: the .NET 10 SDK, Git and a web browser. No database server, no Node.js, no other downloads: the solution uses no NuGet packages.

Step 1. Install the .NET 10 SDK

Check whether it is already there:

```
dotnet --list-sdks
```

You need a line starting with `10.`. The **SDK** is required to build and run from source (having only the "runtime" is not enough; if `dotnet --list-sdks` prints nothing but `dotnet --list-runtimes` shows something, install the SDK).

System	How
Windows	Download the installer from <https://dotnet.microsoft.com/download/dotnet/10.0> (SDK, x64) and run it, or `winget install Microsoft.DotNet.SDK.10`
macOS	Installer from the same page, or `brew install --cask dotnet-sdk`
Ubuntu / Debian	`sudo apt-get update && sudo apt-get install -y dotnet-sdk-10.0` (or follow Microsoft's instructions for your version)

Close and reopen the terminal, then run `dotnet --version`. It should print `10.x.x`.

Step 2. Get the code

```
git clone https://github.com/nurulhasan2k/library-platform.git
cd library-platform
git checkout main
```

(If you received a zip file instead, unzip it and open a terminal in the folder that contains `LibraryPlatform.sln`.)

Step 3. Run it

```
dotnet run --project src/Library.Web
```

The first run restores and builds (about a minute) and creates `data/library.json` with the demo data. Wait for:

```
Now listening on: http://localhost:5080
```

Shortcuts: `scripts/run.sh` (macOS/Linux) or `scripts\run.ps1` (Windows PowerShell). Leave this window open. Stop the site with `Ctrl+C`.

Step 4. Open the site and sign in

1. Browse to <http://localhost:5080>. The public search page appears (it works on a phone-sized window too).
2. **Select the relevant location branch** (library branch): sign in at <http://localhost:5080/staff/login> as `reception` / `reception123`; you are asked to choose **Central Library** or **Northside Library** and a desk. (`reception.river` / `reception123` works at Riverside only.)
3. Other demo accounts:

Role	Username	Password
Admin	`admin`	`admin123`
Reception	`reception`	`reception123`
Reception (Riverside)	`reception.river`	`reception123`
Manager	`manager`	`manager123`
Patron (kiosk and `/account`)	card `LIB-1001`	PIN `1111`

4. Kiosk: <http://localhost:5080/kiosk>. API documentation: <http://localhost:5080/api/docs>. API key for the demo: `demo-api-key-2026`.

Step 5. Check that it works (2 minutes)

Check	Expected
Home page	43 items found, search box and filters
`/kiosk`, card `LIB-1001`, PIN `1111`	"Hello, Ava Thompson"
`curl -H "X-Api-Key: demo-api-key-2026" http://localhost:5080/api/v1/status`	`{"status":"ok", ...}`
Sign in as `manager`, open **Reports**	Dashboard with charts; CSV and PDF buttons work

Optional automated checks (the site does not need to be running): `dotnet run --project tests/Library.Tests` prints `117 passed, 0 failed`.

Resetting the demo data

Stop the site, then:

```
scripts/reset-db.sh          # or scripts\reset-db.ps1   (same as: dotnet run --project src/Librar
   y.Web -- --reset-db --exit)
```

Or delete `data/library.json` and start the site again.

Alternative: build once, run anywhere (only the .NET 10 *runtime* needed to run)

```
dotnet publish src/Library.Web -c Release -o publish
cd publish
dotnet Library.Web.dll --urls http://localhost:5080
```

Settings you may want to change

Defaults need no change. To use another port: `dotnet run --project src/Library.Web --urls http://localhost:5090`. All settings are in `docs/CONFIGURATION.md`. To move the data file: set the environment variable `LIBRARY_DATA_FILE`.

Troubleshooting

Problem	Fix
`dotnet` is not recognised	Install the SDK (step 1) and reopen the terminal
"You must install or update .NET to run this application"	The .NET 10 runtime/SDK is missing or older than 10; install the SDK (step 1)
`Address already in use` / port 5080 busy	Close the other program or use `--urls http://localhost:5090`
Page shows no items / odd data	Stop the site and run the reset command above
"The data file is locked" or save errors	Make sure only one copy of the site is writing; delete `data/library.json.lock` if the site is stopped
Kiosk logs me out	By design after 60 idle seconds (`Kiosk:IdleTimeoutSeconds`)
API returns 401 / 403 / 429	Send `X-Api-Key: demo-api-key-2026`; wait a minute if you hit the rate limit (60 per minute)
Browser warns about HTTPS	The demo runs on plain `http://localhost:5080`; use that address

What was tested

Built and run from a clean copy with the .NET 10 SDK (10.0.112) on Linux without any package download; 117 automated tests pass; a scripted browser walk-through of all 12 demo items passes (67 checks). The same steps apply on Windows and macOS; they have not been tried on the assessor's own VM image, so please report anything unexpected.
